## Visualization of Graphs

## Lecture 2: <br> Force-Directed Drawing Algorithms

Part I:<br>Spring Embedders

Johannes Zink

Summer semester 2024

## General Layout Problem

## Input: Graph $G$

Output: Clear and readable straight-line drawing of $G$

## General Layout Problem

## Input: Graph $G$

Output: Clear and readable straight-line drawing of $G$
Drawing aesthetics to optimize:
■ adjacent vertices are close

- non-adjacent vertices are far apart

■ edges short, straight-line, similar length

- densely connected parts (clusters) form communities
- as few crossings as possible

■ nodes distributed evenly
Optimization criteria partially contradict each other.

## Fixed Edge Lengths?

Input: Graph $G$, required length $\ell(e)$ for each edge $e \in E(G)$.
Output: Drawing of $G$ that realizes the given edge lengths.

NP-hard for
■ uniform edge lengths in any dimension

- uniform edge lengths in planar drawings
- edge lengths in $\{1,2\}$

## Physical Analogy

## Idea.

[Eades '84]
"To embed a graph we replace the vertices by steel rings and replace each edge with a spring to form a mechanical system... The vertices are placed in some initial layout and let go so that the spring forces on the rings move the system to a minimal energy state."

## Physical Analogy

## Idea.

[Eades '84]
"To embed a graph we replace the vertices by steel rings and replace each edge with a spring to form a mechanical system... The vertices are placed in some initial layout and let go so that the spring forces on the rings move the system to a minimal energy state."

## Physical Analogy

## Idea.

[Eades '84]
"To embed a graph we replace the vertices by steel rings and replace each edge with a spring to form a mechanical system... The vertices are placed in some initial layout and let go so that the spring forces on the rings move the system to a minimal energy state."

So-called spring-embedder algorithms that work according to this or similar principles are among the most frequently used graph-drawing methods in practice.

## Attractive forces.

 pairs $\{u, v\}$ of adjacent vertices:

Repulsive forces.
any pair $\{x, y\}$ of vertices:

## Force-Directed Algorithms

## Spring Embedder by Eades - Model

■ Repulsive forces

$$
f_{\mathrm{rep}}\left(p_{u}, p_{v}\right)=\frac{c_{\mathrm{rep}}}{\left\|p_{v}-p_{u}\right\|^{2}} \cdot \overrightarrow{p_{v} p_{u}}
$$

■ Attractive forces
spring constant (e.g., 1.0)

$$
\begin{aligned}
f_{\text {spring }}\left(p_{u}, p_{v}\right) & =c_{\text {spring }} \cdot \log \frac{\left\|p_{v}-p_{u}\right\|}{\ell} \cdot \overrightarrow{p_{u} p_{v}} \\
f_{\text {attr }}\left(p_{u}, p_{v}\right) & =f_{\text {spring }}\left(p_{u}, p_{v}\right)-f_{\text {rep }}\left(p_{u}, p_{v}\right)
\end{aligned}
$$

ForceDirected $\left(\operatorname{graph} G, p=\left(p_{v}\right)_{v \in V}, \varepsilon>0, K \in \mathbb{N}\right)$ $t \leftarrow 1$
while $t \leq K$ and $\max _{v \in V(G)}\left\|F_{v}(t-1)\right\|>\varepsilon$ do foreach $u \in V(G)$ do
$F_{u}(t) \leftarrow \sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\text {attr }}\left(p_{u}, p_{v}\right)$ foreach $u \in V(G)$ do
$p_{u} \leftarrow p_{u}+\delta(t) \cdot F_{u}(t)$
$t \leftarrow t+1$
return $p$

## Notation.

- $\overrightarrow{p_{u} p_{v}}=$ unit vector pointing from $u$ to $v$
- $\left\|p_{v}-p_{u}\right\|=$ Euclidean distance between $u$ and $v$

■ $\ell=$ ideal spring length for edges

■ Resulting displacement vector

$$
F_{u}=\sum_{v \in V(G)} f_{\mathrm{rep}}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\mathrm{attr}}\left(p_{u}, p_{v}\right)
$$

## Spring Embedder by Eades - Force Diagram

$$
f_{\text {attr }}\left(p_{u}, p_{v}\right)=f_{\text {spring }}\left(p_{u}, p_{v}\right)-f_{\text {rep }}\left(p_{u}, p_{v}\right)
$$

Force

## Spring Embedder by Eades - Discussion

## Advantages.

■ very simple algorithm
■ good results for small and medium-sized graphs
■ empirically good representation of symmetry and structure

## Disadvantages.

■ System may not be stable at the end.

- May converge to a local minimum that is not a global minimum.

■ Computing $f_{\text {spring }}$ takes $\mathcal{O}(|E(G)|)$ time; computing $f_{\text {rep }}$ takes $\mathcal{O}\left(|V(G)|^{2}\right)$ time.

## Influence.

■ original paper by Peter Eades [Eades '84] got $\approx 2000$ citations

- basis for many further ideas

## Variant by Fruchterman \& Reingold

ForceDirected (graph $\left.G, p=\left(p_{v}\right)_{v \in V}, \varepsilon>0, K \in \mathbb{N}\right)$ $t \leftarrow 1$
while $t \leq K$ and $\max _{v \in V(G)}\left\|F_{v}(t-1)\right\|>\varepsilon$ do foreach $u \in V(G)$ do
$F_{u}(t) \leftarrow \sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\text {attr }}\left(p_{u}, p_{v}\right)$ foreach $u \in V(G)$ do
$p_{u} \leftarrow p_{u}+\delta(t) \cdot F_{u}(t)$
$t \leftarrow t+1$
return $p$

## Notation.

■ Attractive forces

$$
f_{\text {attr }}\left(p_{u}, p_{v}\right)=\frac{\left\|p_{v}-p_{u}\right\|^{2}}{\ell} \cdot \overrightarrow{p_{u} p_{v}}
$$

- $\left\|p_{u}-p_{v}\right\|=$ Euclidean distance between $u$ and $v$
- $\overrightarrow{p_{u} p_{v}}=$ unit vector pointing from $u$ to $v$
- $\ell=$ ideal spring length for edges

■ Resulting displacement vector

$$
F_{u}=\sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\text {attr }}\left(p_{u}, p_{v}\right)
$$

## Fruchterman \& Reingold - Force Diagram

$f_{\text {spring }}\left(p_{u}, p_{v}\right)=f_{\text {attr }}\left(p_{u}, p_{v}\right)+f_{\text {rep }}\left(p_{u}, p_{v}\right)$

## Adaptability

## degree of vertex $u$, i.e., $|\operatorname{Adj}[u]|$

Inertia. ("Trägheit")

- Define vertex mass $\Phi(u)=1+\operatorname{deg}(u) / 2$
- Set $f_{\text {attr }}\left(u, p_{v}\right)=f_{\text {attr }}\left(p_{u}, p_{v}\right) \cdot 1 / \Phi(u)$

## Gravitation.

■ Define centroid $\sigma_{V}=1 /|V(G)| \cdot \sum_{v \in V(G)} p_{v}$
■ Add force $f_{\mathrm{grav}}(v)=c_{\mathrm{grav}} \cdot \Phi(v) \cdot \overrightarrow{p_{v} \sigma_{V}}$
Restricted drawing area.
If $F_{v}$ points beyond area $R$, clip vector appropriately at the border of $R$.

## And many more...

■ magnetic orientation of edges [GD Ch. 10.4]

- other energy models
- planarity preserving

■ speed-ups

## Speeding up "Convergence" by Adaptive Displacement $\delta_{v}(t)$

```
ForceDirected (graph \(\left.G, p=\left(p_{v}\right)_{v \in V}, \varepsilon>0, K \in \mathbb{N}\right)\)
    \(t \leftarrow 1\)
    while \(t \leq K\) and \(\max _{v \in V(G)}\left\|F_{v}(t-1)\right\|>\varepsilon\) do
        foreach \(u \in V(G)\) do
        \(F_{u}(t) \leftarrow \sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\text {attr }}\left(p_{u}, p_{v}\right)\)
    foreach \(u \in V(G)\) do
        \(p_{u} \leftarrow p_{u}+\delta(t) \cdot F_{u}(t)\)
    \(t \leftarrow t+1\)
    return \(p\)
```

Speeding up "Convergence" by Adaptive Displacement $\delta_{v}(t)$ [Frick, Ludwig, Mehldau '95]

Same direction.<br>$\rightarrow$ increase temperature $\delta_{v}(t)$

## Speeding up "Convergence" by Adaptive Displacement $\delta_{v}(t)$

 [Frick, Ludwig, Mehldau '95]

Same direction.
$\rightarrow$ increase temperature $\delta_{v}(t)$
Oscillation.
$\rightarrow$ decrease temperature $\delta_{v}(t)$

## Speeding up "Convergence" by Adaptive Displacement $\delta_{v}(t)$

## [Frick, Ludwig, Mehldau '95]

Same direction.
$\rightarrow$ increase temperature $\delta_{v}(t)$
Oscillation.
$\rightarrow$ decrease temperature $\delta_{v}(t)$

## Rotation.

- count rotations
- if applicable
$\rightarrow$ decrease temperature $\delta_{v}(t)$

## Speeding up "Convergence" via Grids

## [Fruchterman \& Reingold '91]

■ divide plane into a grid
■ consider repulsive forces only to vertices in neighboring cells
$\square$ and only if the distance is less than some threshold

## Discussion.

■ good idea to improve actual runtime

- asymptotic runtime does not improve
- might introduce oscillation and thus a quality loss

## Speeding up Repulsive-Force Computation with Quad Trees

[Barnes, Hut '86]

## Speeding up Repulsive-Force Computation with Quad Trees

## [Barnes, Hut '86]

$s_{\text {init }}$

- height $h \leq \log _{2}\left(\frac{s_{\text {init }}}{d_{\text {min }}}\right)+\frac{3}{2}$
- $h \in \mathcal{O}(\log n)$ if vertices evenly distributed in the initial box
- time/space in $\mathcal{O}(h n)$
- compressed quad tree can be computed in $\mathcal{O}(n \log n)$ time

## Speeding up Repulsive-Force Computation with Quad Trees

## [Barnes, Hut '86]

for each child $R_{i}$ of a vertex on path from root to $u$.

## Visualization of Graphs

## Lecture 2: <br> Force-Directed Drawing Algorithms

Part II:<br>Tutte Embeddings

## Idea

Consider a fixed triangle $(a, b, c)$ with a common neighbor $v$

## Where would you place $v ?$

$\operatorname{barycenter}\left(x_{1}, \ldots, x_{k}\right)=\sum_{i=1}^{k} x_{i} / k$
William T. Tutte

## Idea.

Repeatedly place every vertex at barycenter of neighbors.

## Tutte's Forces

## Goal.

$$
\begin{aligned}
p_{u} & =\operatorname{barycenter}(\operatorname{Adj}[u]) \\
& =\sum_{v \in \operatorname{Adj}[u]} p_{v} / \operatorname{deg}(u)
\end{aligned}
$$

$$
\begin{aligned}
F_{u}(t) & =\sum_{v \in \operatorname{Adj}[u]} p_{v} / \operatorname{deg}(u)-p_{u} \\
& =\sum_{v \in \operatorname{Adj}[u]}\left(p_{v}-p_{u}\right) / \operatorname{deg}(u) \\
& =\sum_{v \in \operatorname{Adj}[u]} \frac{\left\|p_{u}-p_{v}\right\|}{\operatorname{deg}(u)} \overrightarrow{p_{u} p_{v}}
\end{aligned}
$$

■ Repulsive forces $f_{\text {rep }}\left(p_{u}, p_{v}\right)=0$
■ Attractive forces

$$
f_{\mathrm{attr}}\left(p_{u}, p_{v}\right)=\left\{\begin{array}{l}
0 \\
\frac{\left\|p_{u}-p_{v}\right\|}{\operatorname{deg}(u)} \overrightarrow{p_{u} p_{v}}
\end{array}\right.
$$

```
ForceDirected (graph \(\left.G, p=\left(p_{v}\right)_{v \in V}, \varepsilon>0, K \in \mathbb{N}\right)\)
    \(t \leftarrow 1\)
    while \(t \leq K\) and \(\max _{v \in V(G)}\left\|F_{v}(t-1)\right\|>\varepsilon\) do
    foreach \(u \in V(G)\) do
        \(F_{u}(t) \leftarrow \sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\text {attr }}\left(p_{u}, p_{v}\right)\)
    foreach \(u \in V(G)\) do
        \(p_{u} \leftarrow p_{u}+\downarrow \subset 1 \cdot F_{u}(t)\)
        \(t \leftarrow t+1\)
    return \(p\)
                                \(\operatorname{barycenter}\left(x_{1}, \ldots, x_{k}\right)=\sum_{i=1}^{k} x_{i} / k\)
ForceDirected(graph \(\left.G, p=\left(p_{v}\right)_{v \in V}, \varepsilon>0, K \in \mathbb{N}\right)\)
\(t \leftarrow 1\)
while \(t \leq K\) and \(\max _{v \in V(G)}\left\|F_{v}(t-1)\right\|>\varepsilon\) do
foreach \(u \in V(G)\) do
\[
F_{u}(t) \leftarrow \sum_{v \in V(G)} f_{\text {rep }}\left(p_{u}, p_{v}\right)+\sum_{v \in \operatorname{Adj}[u]} f_{\mathrm{attr}}\left(p_{u}, p_{v}\right)
\]
foreach \(u \in V(G)\) do
\[
p_{u} \leftarrow p_{u}+\delta<1 \cdot F_{u}(t)
\]
\(t \leftarrow t+1\)
return \(p\)
\[
\operatorname{barycenter}\left(x_{1}, \ldots, x_{k}\right)=\sum_{i=1}^{k} x_{i} / k
\]
```

Global minimum: $p_{u}=(0,0) \forall u \in V(G)$

if $u$ fixed, otherwise.

Solution: fix coordinates of outer face!

$$
\begin{aligned}
& \overrightarrow{p_{u} p_{v}}=\text { unit vector pointing } \\
& \text { from } u \text { to } v \\
& \left\|p_{u}-p_{v}\right\|=\text { Euclidean distance } \\
& \text { between } u \text { and } v
\end{aligned}
$$

## System of Linear Equations

Goal. $p_{u}=\left(x_{u}, y_{u}\right)$
$p_{u}=\operatorname{barycenter}(\operatorname{Adj}[u])=\sum_{v \in \operatorname{Adj}[u]} p_{v} / \operatorname{deg}(u)$

$$
A x=b \quad A y=b \quad b=(0)_{n}
$$

$$
\begin{aligned}
& x_{u}=\sum_{v \in \operatorname{Adj}[u]} x_{v} / \operatorname{deg}(u) \Leftrightarrow \operatorname{deg}(u) \cdot x_{u}=\sum_{v \in \operatorname{Adj}[u]} x_{v} \Leftrightarrow \operatorname{deg}(u) \cdot x_{u}-\sum_{v \in \operatorname{Adj}[u]} x_{v}=0 \\
& y_{u}=\sum_{v \in \operatorname{Adj}[u]} y_{v} / \operatorname{deg}(u) \Leftrightarrow \operatorname{deg}(u) \cdot y_{u}=\sum_{v \in \operatorname{Adj}[u]} y_{v} \Leftrightarrow \operatorname{deg}(u) \cdot y_{u}-\sum_{v \in \operatorname{Adj}[u]} y_{v}=0
\end{aligned}
$$

$\left.\begin{array}{l}u_{1} \\ u_{2} \\ u_{3} \\ u_{4} \\ u_{5} \\ u_{6}\end{array} \begin{array}{rrrrrr}u_{1} & u_{2} & u_{3} & u_{4} & u_{5} & u_{6} \\ 3 & -1 & -1 & 0 & -1 & 0 \\ -1 & 3 & -1 & -1 & 0 & 0 \\ -1 & -1 & 3 & 0 & 0 & -1 \\ 0 & -1 & 0 & 3 & -1 & -1 \\ -1 & 0 & 0 & -1 & 2 & 0 \\ 0 & 0 & -1 & -1 & 0 & 2\end{array}\right)$

$$
\begin{aligned}
& A_{i i}=\operatorname{deg}\left(u_{i}\right) \\
& A_{i j, i \neq j}= \begin{cases}-1 & u_{i} u_{j} \in E \\
0 & u_{i} u_{j} \notin E\end{cases}
\end{aligned}
$$

$n$ variables, $n$ constraints, $\operatorname{det}(A)=0$ $\Rightarrow$ no unique solution

## System of Linear Equations

## Theorem.

$=$ Tutti drawing
Goal. $p_{u}=\left(x_{u}, y_{u}\right)$
$p_{u}=\operatorname{barycenter}(\operatorname{Adj}[u])=$
Tutte's barycentric algorithm admits a unique solution.
It can be computed in polynomial time.
$x_{u}=\sum_{v \in \operatorname{Adj}[u]} x_{v} / \operatorname{deg}(u) \Leftrightarrow \operatorname{deg}(u) \cdot x_{u}=\sum_{v \in \operatorname{Adj}[u]} x_{v} \Leftrightarrow \operatorname{deg}(u) \cdot x_{u}-\sum_{v \in \operatorname{Adj}[u]} x_{v}=0$
$y_{u}=\sum_{v \in \operatorname{Adj}[u]} y_{v} / \operatorname{deg}(u) \Leftrightarrow \operatorname{deg}(u) \cdot y_{u}=\sum_{v \in \operatorname{Adj}[u]} y_{v} \Leftrightarrow \operatorname{deg}(u) \cdot y_{u}-\sum_{v \in \operatorname{Adj}[u]} y_{v}=0$

$k$ variables, $k$ constraints, $\operatorname{det}(A)>0$
$k=\#$ free vertices
$\Rightarrow$ unique solution
$A_{i i}=\operatorname{deg}\left(u_{i}\right)$
$A_{i j, i \neq j}= \begin{cases}-1 & u_{i} u_{j} \in E \\ 0 & u_{i} u_{j} \notin E\end{cases}$
Solution:

1. No need to change fixed vertices.
2. Constraints that depend on fixed vertices are constant and can be moved into $b$.

## 3-Connected Planar Graphs

(up to the choice of the outer face and mirroring)
$G$ planar:
$G$ can be drawn such that no two edges cross each other.
$G$ connected: $\exists u-v$ path for every vertex pair $\{u, v\}$.
$k$-connected: $\quad G-\left\{v_{1}, \ldots, v_{k-1}\right\}$ is connected for any $k-1$ vertices $v_{1} \ldots, v_{k-1}$. Or (equivalently if $G \neq K_{k}$ ):
There are at least $k$ vertex-disjoint $u-v$ paths for every vertex pair $\{u, v\}$.

## Theorem. <br> [Whitney 1933]

Every 3-connected planar graph
has a unique planar embedding.

## Proof sketch.

$\Gamma_{1}, \Gamma_{2}$ planar embeddings of $G$.
Let $C$ be a face of $\Gamma_{2}$, but not of $\Gamma_{1}$. $u$ inside $C$ in $\Gamma_{1}, v$ outside $C$ in $\Gamma_{1}$ both on same side in $\Gamma_{2}$

## Tutte's Theorem

## Theorem.

[Tutte 1963]
Let $G$ be a 3-connected planar graph, and let $C$ be a face of its unique embedding.
If we fix $C$ on a strictly convex polygon, then the Tutte drawing of $G$ is planar and all its faces are strictly convex.

## Properties of Tutte Drawings

Property 1. Let $v \in V(G)$ be free (i.e., not fixed), $\ell$ line through $\exists u \in \operatorname{Adj}[v] \cap \ell^{+} \Rightarrow \exists w \in \operatorname{Adj}[v] \cap \ell^{-}$.
Otherwise, all forces pull $v$ to the same side
Property 2. All free vertices lie inside

## Proof of Tutte's Theorem

Lemma. Let $u v$ be a non-boundary edge, $\ell$ line through $u v$. Then the two faces $f_{1}, f_{2}$ incident to $u v$ lie completely on opposite sides of $\ell$.

Property 1. Let $v$ be a free vertex, $\ell$ line through $v$. $\exists x \in \operatorname{Adj}[v] \cap \ell^{+} \Rightarrow \exists w \in \operatorname{Adj}[v] \cap \ell^{-}$.
Property 3. Let $\ell$ be any line.
Let $V_{\ell}$ be the set of vertices on one side of $\ell$. Then $G\left[V_{\ell}\right]$ is connected.
$x$ and $w$ on different sides of $\ell \Rightarrow f_{1}, f_{2}$ have angles $<\pi$ at $v$.
Lemma. All faces are strictly convex.

Lemma. The drawing is planar.

Assume that point $p$ lies in two faces.
Property 2. All free vertices lie inside $C$.
$\Rightarrow q$ lies in one (i.e., the outer) face.
When jumping an edge, \#faces doesn't change.
$\Rightarrow p$ lies in one face. 4

## Discussion

■ In practice, force-directed graph drawing methods are very often used.
■ Numerous variants, adaptations, and extensions exist.

- They are well-suited for small and medium-size graphs (up to $\approx 100$ vertices).

■ A way to deal with larger graphs, is to coarsen the graph by merging vertices and first to draw the coarsened graph and then to unpack and draw the vertices to the original graph.

■ In practice, the related technique of multidimensional scaling (MDS) is often used, too. There, for every pair of vertices, an optimal distance (the distance in the graph) is determined and a drawing with these optimal distances is computed in high-dimensional space. Afterwards this drawing is projected into the plane.

- From a theoretical perspective, Tutte drawings posses many powerful properties.

■ If a graph is not 3-connected, we can (temporarily) add sufficiently many edges.
■ In practice, Tutte drawings are hardly used because the inner parts often become tiny.
