Lecture 12. Rearrangement distance of phylogenetic trees

# Phylogenetic trees

# Phylogenetic trees

Let  $X = \{1, 2, \dots, n\}$ .

A **phylogenetic tree**  $T$  is a rooted, binary tree where the leaves are bijectively labelled with  $X$ .

Inference methods compute a phylogenetic tree based on some model and data.

Different methods/models/data yield different phylogenetic trees.

■ How can we **compare**  $T$  and  $T'$ ?

→ We want a **metric** on phylogenetic trees.

# Subtree Prune & Regraft (SPR)

Define **SPR-rearrangement graph**  $G = (V, E)$  with

- $V = \{ \text{all phylogenetic trees on } X \}$  and
- $\{T, T'\} \in E$  if  $T$  can be transformed into  $T'$  with an SPR.

# SPR-distance

Define the **SPR-distance** of  $T$  and  $T'$  as

$$d_{\text{SPR}}(T, T') = \text{distance of } T \text{ and } T' \text{ in } G.$$

**Lemma.** The SPR-rearrangement graph  $G$  is connected.

**Proof.** See blackboard (or exercise).

**Corollary.** The SPR-distance is a metric.

**Proof.**  $G$  is connected and undirected.

**Goal.** Compute the SPR-distance  $d_{\text{SPR}}(T, T')$ .

**Problem.**  $G$  is huge!

$$|V(G)| = (2n - 3)!! = (2n - 3) \cdot (2n - 5) \cdot \dots \cdot 5 \cdot 3$$

■ Can we rephrase the problem?

# Maximum agreement forests

# Maximum agreement forests

An **agreement forest**  $F$  of  $T$  and  $T''$  is a forest  $\{T_\rho, T_1, T_2, \dots, T_k\}$  such that

- label sets of the  $T_i$  partition  $X \cup \{\rho\}$ ,
- $\rho$  is in label set of  $T_\rho$ , and
- there exist edge-disjoint embeddings of subdivisions of the  $T_i$ 's into  $T$  and  $T''$  that cover all edges.

If  $k$  is minimal,  $F$  is a **maximum agreement forest (MAF)**.

# Characterisation

Let  $F = \{T_\rho, T_1, T_2, \dots, T_k\}$  be a MAF of  $T$  and  $T'$ .  
Then define

$$m(T, T') = k.$$

**Theorem.** Let  $T$  and  $T'$  be two phylogenetic trees on  $X$ .  
Then

$$m(T, T') = d_{\text{SPR}}(T, T').$$

**Proof.** See blackboard.

**Theorem.** Computing the SPR-distance of  $T$  and  $T'$  is NP-hard.

**Proof** is via reduction from Exact Cover by 3-Sets.

See Bordewich, Semple, "On the computational complexity of the rooted subtree prune and regraft distance" and Hein et al., "On the complexity of comparing evolutionary trees" for details.

# Kernelisation (1 of 2)

## ■ Common subtree reduction:

Replace any pendant subtree that occurs identically in both trees by a single leaf with a new label.

**Lemma.** Applying common subtree reduction is safe; i.e.  $d_{\text{SPR}}(T, T') = d_{\text{SPR}}(S, S')$ .

## Proof.

Suppose

is covered by  
two trees of  
MAF

then there is  
alternative  
MAF

# Kernelisation (2 of 2)

## ■ Chain reduction:

Replace any chain of leaves that occurs identically in both trees by three new leaves.

**Lemma.** Applying chain reduction is safe; i.e.  
 $d_{\text{SPR}}(T, T') = d_{\text{SPR}}(S, S')$ .

## Proof.

Show there is a tree with abc-chain in a MAF.

### Case 1 $F$ into $S$

# Kernelisation (2 of 2)

## ■ Chain reduction:

Replace any chain of leaves that occurs identically in both trees by three new leaves.

**Lemma.** Applying chain reduction is safe; i.e.  
 $d_{\text{SPR}}(T, T') = d_{\text{SPR}}(S, S')$ .

## Proof.

Show there is a tree with abc-chain in a MAF.

Case 2  $F$  into  $S$

# Kernelisation (2 of 2)

## ■ Chain reduction:

Replace any chain of leaves that occurs identically in both trees by three new leaves.

**Lemma.** Applying chain reduction is safe; i.e.  
 $d_{\text{SPR}}(T, T') = d_{\text{SPR}}(S, S')$ .

## Proof.

Show there is a tree with abc-chain in a MAF.

Swap abc-chain with original chain for MAF of  $T$  and  $T'$ .

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.

Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, d_{\text{SPR}}(T, T').$$

**Proof.** Let  $F = \{T_\rho, T_1, \dots, T_k\}$  be MAF for  $S$  and  $S'$ .

Let  $n(T_i)$  be #  $T_j$  it overlaps with in embedding of  $F$  into  $T$ .

**Claim 1.**  $\sum_{i=\rho}^k (n(T_i) + n'(T_i)) \leq 4k = 4 \, d_{\text{SPR}}(T, T')$ .

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.

Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, d_{\text{SPR}}(T, T').$$

**Proof.** Let  $F = \{T_\rho, T_1, \dots, T_k\}$  be MAF for  $S$  and  $S'$ .

Let  $n(T_i)$  be #  $T_j$  it overlaps with in embedding of  $F$  into  $T$ .

**Claim 1.**  $\sum_{i=\rho}^k (n(T_i) + n'(T_i)) \leq 4k = 4 \, d_{\text{SPR}}(T, T')$ .

$$\begin{aligned} |V(H)| &= k + 1 \\ &= |E(H)| + 1 \end{aligned}$$

$$\sum n(T_i) = 2|E(H)| \leq 2k$$

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.  
Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, d_{\text{SPR}}(T, T').$$

**Proof.** Let  $F = \{T_\rho, T_1, \dots, T_k\}$  be MAF for  $S$  and  $S'$ .

Let  $n(T_i)$  be #  $T_j$  it overlaps with in embedding of  $F$  into  $T$ .

**Claim 1.**  $\sum_{i=\rho}^k (n(T_i) + n'(T_i)) \leq 4k = 4 \, d_{\text{SPR}}(T, T')$ .

**Claim 2.** # leaves of  $T_i \leq 7(n(T_i) + n'(T_i))$ .

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.  
Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, d_{\text{SPR}}(T, T').$$

**Proof.** Let  $F = \{T_\rho, T_1, \dots, T_k\}$  be MAF for  $S$  and  $S'$ .

Let  $n(T_i)$  be #  $T_j$  it overlaps with in embedding of  $F$  into  $T$ .

**Claim 1.**  $\sum_{i=\rho}^k (n(T_i) + n'(T_i)) \leq 4k = 4 \, d_{\text{SPR}}(T, T')$ .

**Claim 2.** # leaves of  $T_i \leq 7(n(T_i) + n'(T_i))$ .

$$\sum_{i=\rho}^k \text{\# leaves of } T_i \leq$$

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.  
Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, \text{d}_{\text{SPR}}(T, T').$$

**Proof.** Let  $F = \{T_\rho, T_1, \dots, T_k\}$  be MAF for  $S$  and  $S'$ .

Let  $n(T_i)$  be #  $T_j$  it overlaps with in embedding of  $F$  into  $T$ .

**Claim 1.**  $\sum_{i=\rho}^k (n(T_i) + n'(T_i)) \leq 4k = 4 \, \text{d}_{\text{SPR}}(T, T')$ .

**Claim 2.** # leaves of  $T_i \leq 7(n(T_i) + n'(T_i))$ .

$$\sum_{i=\rho}^k \text{\# leaves of } T_i \leq \sum_{i=\rho}^k 7(n(T_i) + n'(T_i)) \leq 28k.$$

# Kernelisation and fpt algorithm

**Theorem.** Reduce  $T$  and  $T'$  to  $S$  and  $S'$  by exhaustively applying the reduction rules.  
Let  $S$  and  $S'$  be on  $X'$ . Then

$$|X'| \leq 28 \, d_{\text{SPR}}(T, T').$$

**Corollary.** Computing  $d_{\text{SPR}}(T, T')$  is fixed-parameter tractable when parameterized by  $d_{\text{SPR}}(T, T')$ .

**Proof.** ■ Reduce  $T$  and  $T'$  to  $S$  and  $S'$ . Let  $k = d_{\text{SPR}}(S, S')$ .

- $S$  has at most  $4|X'|^2$  neighbours.
  - $S$  has  $\leq 2|X'|$  edges to cut and attach to.
- Length- $k$  BFS from  $S$  visits at most  $O((4|X'|^2)^k) = O((56k)^{2k})$  trees.

# Approximation algorithm

**Algorithm:** dSPRApprox( $T, T'$ )

$i \leftarrow 1$

$G_i \leftarrow T$

$H_i \leftarrow T'$

**while**  $\exists$  pair of sibling leaves  $a$  and  $b$  in  $G_i$  **do**  
     find the case that applies to  $a$  and  $b$  in  $H_i$   
     apply the corresponding transaction  
     to obtain  $G_{i+1}$  from  $G_i$  and  $H_{i+1}$  from  $H_i$   
      $i++$

**return**  $H_i$

Case 1

Case 2

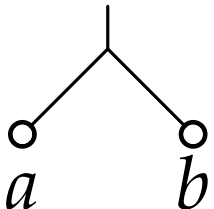

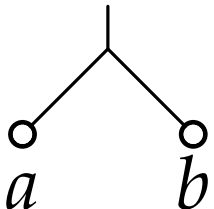

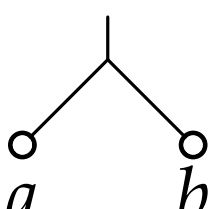

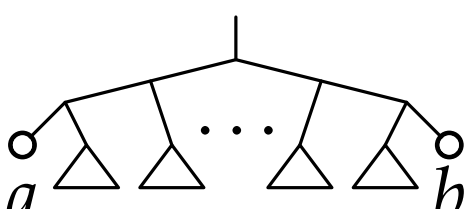

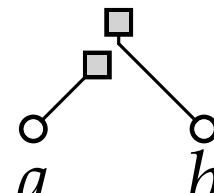

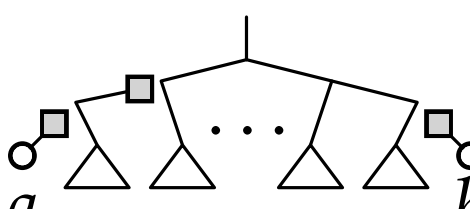

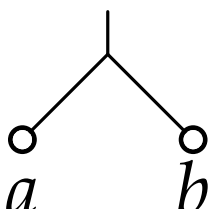

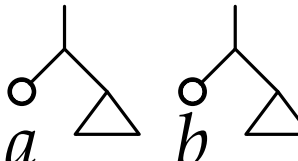

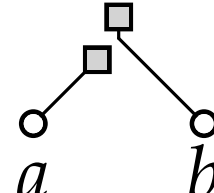

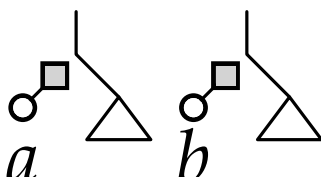

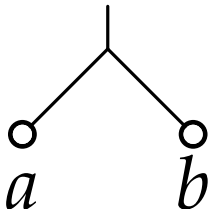

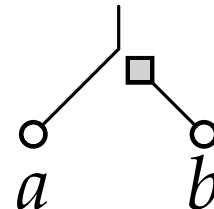

Case 3

Case 4

# Approximation algorithm

Case	$G_i$	$H_i$	$\longrightarrow$	$G_{i+1}$	$H_{i+1}$	Cost
1						no mistake
2						3 cuts 1+ good
3						2 cuts 1+ good
4						1 cut 1 good

# Approximation algorithm

Case     $G_i$                        $H_i$                        $G_{i+1}$                        $H_{i+1}$                       Cost

**Theorem.** dSPRApprox is a 3-approximation algorithm for  $d_{\text{SPR}}(T, T')$  with  $O(|X|^2)$  running time.

instance

$a$        $b$

$a$        $b$
